

Connecting Localdb using Sql Server Management Studio

Posted by Ajay Prajapati on Friday, September 27, 2019

This post is about connecting and managing SQL Server LocalDB instances with Sql Server Management Studio. While working on an Django web application, I was using LocalDB, but when I tried to connect to it and modifying the data, but I couldn't find it. Later after exploring little I found one way of doing it.

1. First execute following command from in Command Prompt Or powershell window.

```
CD "C:\Program Files\Microsoft SQL Server\130\Tools\Binn"
```

```
C:\Program Files\Microsoft SQL Server\130\Tools\Binn>SqlLocalDB.exe info mssqllocaldb
```

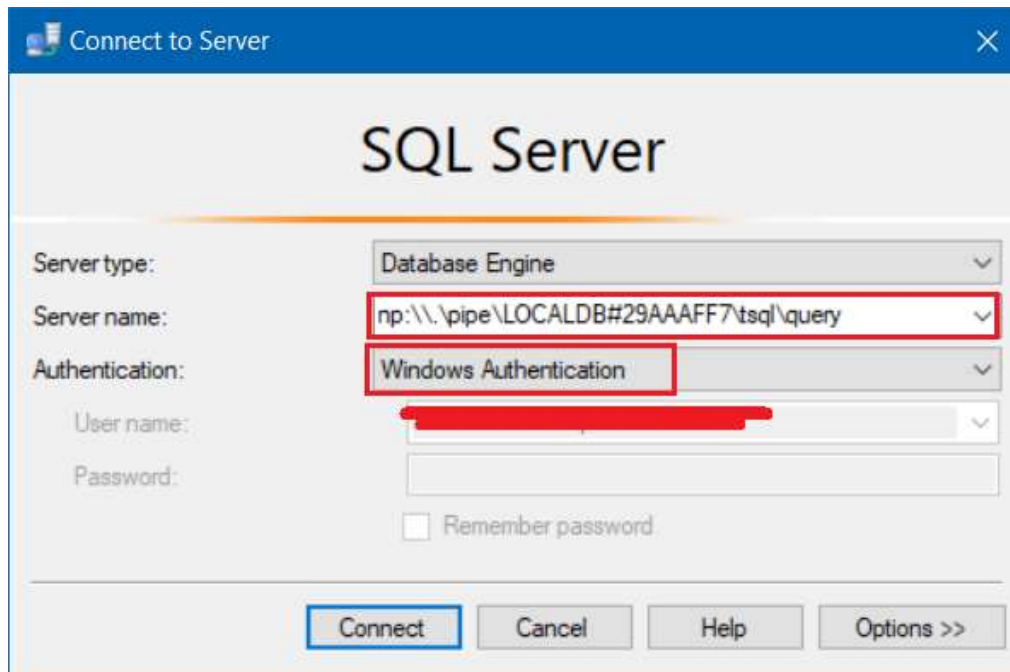

It will return something like this.

```
mssqllocaldb
Name:                mssqllocaldb
Version:             13.1.4001.0
Shared name:         {00000000-0000-0000-0000-000000000000}
Owner:               NT AUTHORITY\SYSTEM
Auto-create:         Yes
State:               Stopped
Last start time:     21-12-2017 15:54:02
Instance pipe name:  {00000000-0000-0000-0000-000000000000}
```

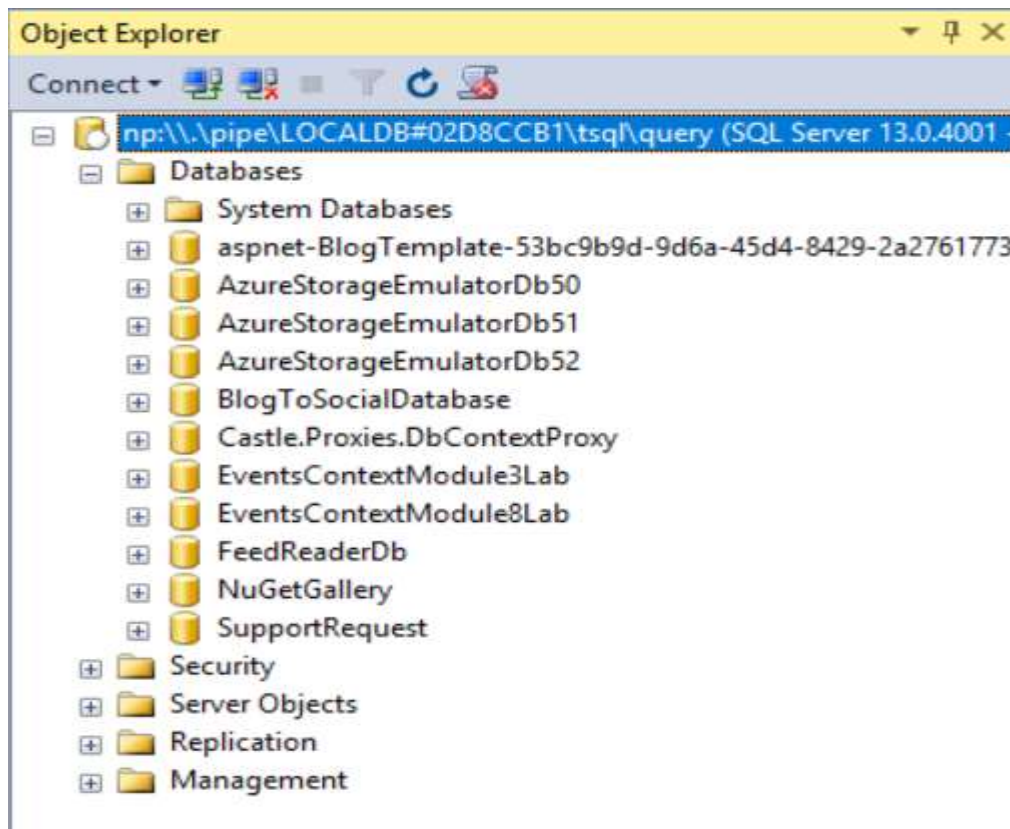

If you notice the State is stopped and Instance Pipe name is empty. You need to start the instance first, you can either do it with **start** commandline parameter with argument instance name. Or you can run your ASP.NET Core application. Once it is running, the command will display output like this.

```
mssqllocaldb
Name:                mssqllocaldb
Version:             13.1.4001.0
Shared name:         {00000000-0000-0000-0000-000000000000}
Owner:               NT AUTHORITY\SYSTEM
Auto-create:         Yes
State:               Stopped
Last start time:     21-12-2017 15:54:02
Instance pipe name:  {00000000-0000-0000-0000-000000000000}
```

You need to copy the **Instance Pipe name:** or **Name:** and paste it in SSMS Connect to server dialog, like this.

Also you need to change the authentication mode to Windows. Click connect, you will be able to connect to LocalDB using SSMS. You can execute command, modify records etc with SSMS.

Please note, the connection string will be changing every time. So before connecting to the DB you need to run the command to get the connection string. Happy Programming :)
